COMICCRAFT AI

PROJECT DOCUMENTATION

1. Project Overview

ComicCraft AI is a web-based comic generation project designed to present a short story as a sequence of illustrated comic panels. Each panel combines a scene image, panel title, character dialogue, and narrative text. The generated result can be viewed as a complete comic and downloaded as a PDF.

2. Problem Statement

Creating a complete comic manually requires separate work for story writing, dialogue preparation, image selection or generation, panel arrangement, and final document formatting. ComicCraft AI brings these activities together into a single web experience.

3. Objectives

- Generate a short story in comic-panel format.
- Combine dialogue with matching visual scenes.
- Present the story in a clean, readable layout.
- Support a five-panel narrative structure.
- Provide a PDF version for sharing or submission.

4. Main Features

- Five-panel comic presentation.
- Panel titles: The Discovery, The Shock, The Confusion, The Decision, and The Happy Ending.
- Character dialogue and narrative text.
- Scene images matched to the story context.
- Tanglish-style dialogue in the demonstrated output.
- PDF download option.
- Back to Home navigation.
- Browser-based local web application.

5. Demonstrated Story Flow

Panel	Title	Purpose
1	The Discovery	A mysterious laptop is discovered in a college library.
2	The Shock	Opening the laptop reveals unexpected news.
3	The Confusion	The character discusses the situation with friends.
4	The Decision	The character decides to change the future.
5	The Happy Ending	The story concludes with a positive future.

6. User Workflow

- Open the ComicCraft AI web application.
- Enter or generate story content.
- Organize the content into comic panels.
- Review the image, title, dialogue, and narrative in each panel.
- Review the complete comic.
- Use Download PDF to obtain the final document.
- Use Back to Home to return to the home page.

7. System Flow

User Input → Story/Dialogue Processing → Panel Creation → Image + Text Combination → Comic Preview → PDF Generation/Download

8. Functional Requirements

- Provide a web page for the comic workflow.
- Organize content into multiple panels.
- Support a title, image, dialogue, and narrative for each panel.
- Display the final comic in a readable layout.
- Provide PDF download.
- Provide navigation back to Home.

9. Non-Functional Requirements

- Usability: simple interface for first-time users.
- Readability: clear separation of images and text.
- Performance: panel content should load efficiently.
- Reliability: PDF generation/download should work consistently.
- Maintainability: story, panel, and UI logic should be organized clearly.

10. Technologies

The supplied project output confirms a browser-based web application and a generated PDF comic. The local route shown in the output is 127.0.0.1:8000/comic. The exact source-code framework, programming language, database, and AI/image APIs cannot be verified because the supplied ZIP contains the generated PDF output rather than the source-code files.

11. User Interface Description

- Panel-based card layout.
- Prominent panel title.
- Large scene image.
- Dialogue and narrative below the image.
- Download PDF and Back to Home controls on the final page.

12. Example Output

The supplied output contains a five-part story featuring Anu. It begins in a college library, introduces a mysterious laptop, moves through shock and confusion, reaches a decision about the future, and ends with a positive future-oriented conclusion.

13. Advantages

- Reduces manual comic-formatting effort.
- Combines textual and visual storytelling.
- Produces a structured multi-panel result.
- Provides a downloadable document.
- Can be extended with more stories, characters, themes, and panel counts.

14. Limitations

- Only the generated PDF output was supplied for this documentation.
- Source-code architecture and backend details cannot be confirmed.
- The demonstrated output contains five panels.
- The exact AI model/API is not identifiable from the supplied output alone.

15. Future Enhancements

- Variable number of panels.
- Character creation and consistency controls.
- Multiple art styles and themes.
- Multiple languages and translation.
- Editing of individual panel dialogue and images.
- User accounts and saved projects.
- Shareable comic links.
- Improved image/server error handling.

16. Testing Checklist

Test Case	Expected Result	Status
Open comic page	Comic page loads successfully	To be tested
View all panels	All five panels appear in sequence	Verified in supplied output
Read dialogue	Dialogue and narrative are readable	Verified in supplied output
Download PDF	PDF is generated/downloaded	Runtime test required
Back to Home	User returns to home page	Runtime test required

17. Conclusion

ComicCraft AI demonstrates a practical approach to combining storytelling, visual content, and web-based document generation. The supplied output presents a five-panel comic with matching images, dialogue, narrative text, and PDF export functionality.

18. Submission Note

For final college submission, add the actual source-code technology stack, architecture diagram, database details (if any), API/model names (if any), installation commands, screenshots of the home/input pages, and source-code module descriptions after checking the source project. These details are not invented here because they are not present in the supplied ZIP.

Academic Project Documentation

ACKNOWLEDGEMENT

We express our sincere gratitude to our project guide, faculty members, department and institution for their valuable guidance and support throughout the development of FitBuddy. We also thank our friends and family for their encouragement and support during the planning, implementation and testing of the project.
